Acute and Chronic Renal Failure (Topics in Renal Disease)

M. Boulton-Jones

Acute and Chronic Renal Failure (Topics in Renal Disease) M. Boulton-Jones

Renal function fails abruptly in a bewildering variety of clinical situations which lack any common clinical pattern. This makes it impossible to define acute renal failure in the same way as heart failure or liver failure. Even oliguria, the commonest sign, is not invariably present. As a result, the detection of acute renal failure is difficult. Table 1. Causes of acute renal failure. Acute tubular necrosis Ischaemic type Nephrotoxic type Cortical necrosis . Hepatorenal syndrome Occlusion of main renal arteries Occlusion of arterioles Malignant hypertension Haemolytic uraemic syndrome Thrombotic thrombocytopenic purpura Postpartum nephrosclerosis Acute glomerulonephritis Post-streptococcal 'Crescentic' nephritis } do thO th t dO Necrotizing glomerulonephritis I IOpa IC WI sys emlc Iseases Renal vein thrombosis Obstruction U ric acid crystals Stones Tumours-benign and malignant Fibrosis Strictures 2 Acute and Chronic Renal Failure (ARF) depends on biochemical tests, which are fortunately simple to perform and are commonly available. However, the clinician has to think of the possibility in order to test the diagnosis. Frequently, patients are admitted to a renal unit from medical, surgical or gynaecological wards where the development of ARF has gone unrecognized, either because the relevant investigation has not been performed or because the result has been overlooked. This happens because ARF occurs in patients with complex problems which themselves demand considerable attention, and it is easy to overlook a comparatively rare, if important, complication.
